

BETA SIGMA CORPORATION

Technology Requirements — Subsidiary Submission Form

With the Group CTO joining, each subsidiary is required to identify its technology needs and benchmark the leading digital solutions used within its industry. Your responses will be used to develop a Group-wide technology roadmap. The objective is not simply to identify software requirements, but to understand how leading organisations in your industry leverage technology so that Beta Sigma can build best-in-class digital capabilities across all its businesses.

Please complete all sections and return by the deadline above.

1. Business Overview

Name of subsidiary: Chasing Sun

Completed by: Josiah Stanley

Date: 04/07/26

Briefly describe what your business does — your services, your customers, and how you currently operate:

We are horticulture and commodity trade enterprise growing produce in Naivasha and trading commodities in East Africa. Our customers are typically B2B clients, as we trade on volumes of 1MT+. Our clients include, packhouses, hotels, specialty tea, and spice companies.

We currently run our communications through WhatsApp and Email, and track our produce through our dashboard linked below:

<https://www.dashboard.chasingsun.africa/dashboard>

Asides from this we use MS excel for all our financials

2. Current Technology

List all systems, platforms, apps, and tools your team currently uses. Include everything — even WhatsApp or Excel.

1. Email (Outlook)
2. WhatsApp
3. Excel
4. Word
5. PowerPoint
6. Adobe Acrobat
7. Claude
8. Chat GPT

3. Current Challenges

Describe the technology problems your business is experiencing right now. Be as specific as possible.

Examples:

- **Too many manual processes — invoicing, tracking, follow-ups all done by hand.**
- **No central place to store documents — files are on personal phones and laptops.**

These are our two main pain points:

1. In finance, we have several excels sheets we utilise to track our revenues and expenses for commodity and horticulture. A streamlined system like QuickBooks would be good to be able to quickly track daily, weekly monthly revenues and expense.
2. We have categorised our data in a department specific sense i.e.
 - Operations
 - Finance
 - Marketing
 - Etc

This is however computer based, and anyone handling oversight for CS, would need to access employee computers to be able to access this data.

Lastly, our farm dashboard currently assists with crop planting and monitors greenhouse productivity, as well as weekly revenue collection. The next step would be for this same platform to be IOT enabled so as to aid real time greenhouse data. That is:

1. Soil moisture levels
2. Humidity in greenhouse
3. Greenhouse temperature
4. Wind speed

4. Technology Requirements

List the technology or systems your business requires to operate effectively. For each requirement, state what you need and why you need it. You do not need to know the name of a specific product — describe what you want it to do.

I need a centralised system to track my expenses and revenue on daily, weekly and monthly basis. One that an accountant can interact with, and C suite can easily log in and get a quick idea of our financial standing at any given time. The system should also be able to generate invoices, and delivery notes.

Additionally, a system to centralise our documentation for C suite to access in the blink of an eye.

Lastly, greenhouse sensors embedded into our existing dashboard in the ways described above

5. Industry Benchmark

Research at least two leading companies in your industry and identify the technology or software they use. This section will help the CTO understand what best-in-class looks like for your sector.

For each company, include:

- Company name
- System or software used
- What it does
- How a similar solution would benefit your business

Smeding Groenten en Fruit — Netherlands

System or software used: SAP S/4HANA

What it does:

Smeding uses SAP S/4HANA to manage core fresh produce processes including procurement, sales, logistics, order handling and financial visibility.

How a similar solution would support Chasing Sun:

A solution of this nature would give Chasing Sun a centralised platform for tracking revenue, expenses, invoices, delivery notes, stock movement and customer transactions. It would also give management clearer real-time visibility of the company's financial and operational position.

Sundrop Farms — Australia

- System or software used: Tailored greenhouse automation solution by Init
- Reference: <https://initgroup.com/case/tailored-automation-solution-for-sundrops-cutting-edge-greenhouse-technology/>

What it does:

Sundrop Farms uses greenhouse automation technology to support its controlled-environment farming model, including hydroponics, water management, climate control and crop production monitoring.

How a similar solution would support Chasing Sun:

A solution of this nature would allow Chasing Sun to connect greenhouse sensors to its existing dashboard and monitor key production conditions in real time, including soil moisture, humidity, greenhouse temperature, wind speed and crop performance.

6. Hardware Requirements

List any physical equipment your team needs that you do not currently have or that needs to be replaced.

Microphones – Marketing use for videos

Phone – Replace existing CS phone (not urgent)

7. Priority

For each item listed in Sections 4, 5, and 6, indicate how urgently it is needed:

- High - Finance system
 - Medium — System to centralise the documentation we work on, and IOT sensors in greenhouse
 - Low — useful in the long run but not urgent.
-

8. Additional Comments

Include any other technology needs, ideas, or concerns not covered above.

Please return this completed form by the deadline above. Thank you.
